No correlation. Sometimes negative. Until time series length is less than a half-century, the statistics of the mean are not reliable; it becomes increasingly difficult to find statistically significant correlations, when the length of the series is near the normal length for the data set (dashed line) in the figure on the right. Averaging over the many possible weather system states at a fixed location, or averaging over many months, can cause even more of this bias. Averaging over many months can reduce this bias, but only if all months are similar. For example, this occurs if the average temperature for January is the same as the average temperature for February. Figure from Holton . Holton, J. R. (1979). An introduction to dynamic meteorology. Amsterdam: Elsevier, pp. 1–5. Print. (Read from 1989 reprint) By plotting the absolute vorticity (5 +) as it changes along a trajectory, one can, in principle, solve for vorticity; but the problem in practice is that vorticity is strongly biased by averaging over many states. Holton (1986) p. 9. 6. Holton, .
