By kampfepdero. Kernel. By kampfepdero. Wird geladen... The program is open source, it has been written in Java with the Open Source Coders Kit. The program is very light, it can be used on any computer even without Java installed. Da's bestätigte er in einem. Thanks to our reviews, our program is easy to use and is safer than your current and previous tools. This is the only program that can remove all user-supplied filters in batch mode, without causing harm to the computer. You can easily download all your files from the safe and fast. The safest and most widely used plug-in and blocklist removal tool. However, if you're using the plug-in, you must use the safety features to keep your security. The program is open source, it has been written in Java with the Open Source Coders Kit. Q: API Name change in PHP for WordPress I have a client which wants to have the API Name for the WordPress theme changed from something like: to: I have all the files re-organized and can do this without too much hassle. However, I don't know where the API Name is, and have searched the Admin area of the WP backend with no luck. Does anyone know how this might be done? I have done this with 1.8.x previously, but that was a while ago and I have completely forgotten. Thanks! A: The file /wp-includes/link-template.php defines the API name for an install. You need to change that, probably in the theme folder. /* * Licensed under the Apache License, Version 2.0 (the "License"); you may not use this file except * in compliance with the License.
