Download A PDF.Page.Crop or remove the white margins (space) from the pages of your PDF files effortlessly with the help of this next. Q: ggplot2 different size according to dataframe I'm using a dataframe with different measures for different subjects (45 subjects in my dataframe). I want to plot the raw measurement vs the raw measurement for each subject. Each subject should have a different marker size, that is: if s1=1, s2=2, s3=3 and s45=45... I'd like the markers to have different size. I was using the following code: ggplot(data=mydf, aes(x=mydf\$G1, y=mydf\$G2)) + geom_point() + geom_point(size=1) where G1 and G2 are my measures, but since it was the same for all subjects (see the result): What I need is the following: Is there a way to do that? A: You could try something like this. You first create a mutate for each subject, then wrap it all in a ggplot and assign the size to the ggplot using the aes() function. library(ggplot2) df %>% group_by(subject) %>% mutate(size = sqrt(G1)) df ggplot(data = df, aes(x = G1, y = G2)) + geom_point() + geom_point(size = df\$size) ba244e880a
