. . . . .Q: Mysql database design - what's the best way to store a list of colors? I'm making a simple web app that has a large list of colors, users can search for them, but ultimately I'd like to be able to add additional colors later. Right now I'm using table with id, name, and hexcode. What's the best way to add new colors? Alternatively, should I just make a simple table with id, name, hexcode, and color_id? (Would this be the correct way to do it if my goal is just the most efficient storage of information?) A: You could do something like that, if you want to keep a historical archive of all colors added. If you want to allow the user to add new colors, maybe you should consider designing the rest of the database and integrate it with your web app with a simple web interface. Mesmerize with previous and present shows, you can order a DVD or download the recording from the website. On Tour Got questions? Ask the experts! (0512/4516) "adobe master collection cs5 Setup File.rar" - 250,30 MB - yEnc. 512.Q: copy constructor + char const * I have read the following question but not working for me. Code: #include class string { public: string(char const *); char const * data; string(string const&); }; int main() { string s; s = "abc"; cout size = (d.size() + 1); } string::string(string const & s) { data = (s.data); this->size = s.size; } Output: [ab] 13 ab This is no surprise, if I debug, the constructors are not called. What I want to do: (1) string s1; (2) s1 = s2; (3) cout f30f4ceada
