I tried to convert my org.eclipse.core.runtime.doc.IStyle instance to org.eclipse.ui.editors.style with this code: IStyle[] a = contentAssistHelper.getModelContentAssistHelper().getStyles(IEditorInput.CONTENT_ASSIST_SELECTED_STYLES_KEY); String[] names = a.length > 0? a[0].getStyleIds() : null; for (String name : names) { if ("org.eclipse.core.runtime.doc.IStyle".equals(name)) { IStyle oldStyle = new IEditorPartStyle(editor, name); if (oldStyle instanceof

org.eclipse.ui.editors.style.IStyle) { ((org.eclipse.ui.editors.style.IStyle)
oldStyle).getStyles(IEditorInput.CONTENT_ASSIST_SELECTED_STYLES_KEY);
} } } But it didn't work. Is there another way to convert the
org.eclipse.core.runtime.doc.IStyle to org.eclipse.ui.editors.style.IStyle? Thanks A:
There is an old-fashioned class org.eclipse.core.runtime.doc.IStyleHelper which
hides many methods needed for Styling. You might want to use it instead of
IEditorPartStyle. a1d647c40b

To do this, a smartphone camera has many sensors including CMOS, CID, 1-3 PIVIS, Laser and many more. There are different types of pixels on a sensor. The common type of pixels are 1.5M, 2M and 3M. Every pixel on a sensor is separated by a distance to capture the colour information of the object. At the same time, some pixels are more sensitive to light than others. Therefore, in the past, the difference between a good smartphone camera and a bad camera was very easy to identify. 1.
