Processing effects of seven cognitive-behavioral therapies for insomnia: A meta-analysis. Sleep research has largely focused on the efficacy of psychotherapies for insomnia (PSTIs) to understand the theoretical basis of behavioral sleep interventions. However, the specific psychotherapies applied in this research have not yet been systematically reviewed and the possibility that biases of different study designs (e.g., open-label versus randomized controlled trials [RCTs]) have been overstated remains understudied. The present meta-analysis employed a random-effects model to examine the effect sizes for six PSTIs in a randomly sampled sample of 955 randomized participants. The effect sizes for each PSTI were compared to determine whether treatments with similar theoretical basis varied in their efficacy and whether each included a significant effect. The results revealed that treatments were differentially effective, with cognitive-behavioral therapy-sleep restriction (CBT-SR) showing the strongest effect ($d = .95$) and sleep hygiene (SH) exhibiting small effects ($d = .54$). Moreover, the results showed that RCTs were more effective than were open-label studies ($d = 1.03$). The findings were also discussed in terms of the current controversies regarding the inconsistencies of medication-based treatments, the efficacy of psychological treatment for insomnia, and potential therapeutic mechanisms for insomnia. The present invention relates to a recording apparatus such as an ink jet printer and the like. In an ink jet printer, it is important that the supply of ink from an ink tank to an ink head should be reliably effected. The ink tank is usually provided with an ink supply tube on its side opposite to the side on which an ink head is mounted. The ink tank is structured with the ink supply tube passing therethrough. A relatively large flow resistance will be caused due to the passage resistance of the ink supply tube. A relatively large ink jet head has a large pump-up volume (the volume of the portion of the ink head situated above the nozzle). The ink supply tube must be constructed large to accommodate the pump-up volume. If the ink supply tube has a large diameter, a large flow resistance is caused at the end of the ink supply tube where the ink head is mounted. There arises a difficulty that the ink flowing in the ink supply tube is not supplied from the supply tank to the ink head with good efficiency. By the way, the ink jet printer, which is of the type ejecting ink drops from a plurality of ink nozzles

Q: Injecting refs for props between components creates many copies of state I have the following situation: `export default class App extends Component { state = { loading: false } componentDidMount() { this.props.fetch('/something') .then(res => { this.setState({ loading: false }) this.props.fetchSomething(res.data) this.props.fetchSomethingElse(res.data) }) } ... }` And the component that fetches something with `fetchSomething` looks like this: `export default class AppComponent extends Component { componentDidMount() { this.props.fetch('/something') .then(res => { // some code let state = {... } return }) } ... }` The `fetchSomething` is not big, so I don't see why I get duplicates of the state, and calling a ref like this: `this.refs.something.props.fetchSomething = this.props.fetchSomething` breaks my application. A: I think what you are asking for is something like this: `export default class App extends Component { state = { loading: false } componentDidMount() { this.props.fetch('/something') .then(res => {`
