If you want to use a paintbrush to select an area, you must first use the Magic Wand tool to select the area first. Move the cursor over the area you want to select and when it is highlighted, double-click with the mouse to select it. Hold down the right button on the mouse to reverse the selection. Alternatively, press the I key on the keyboard and you will see the selection icon in the Layers palette. Click on this icon to select all the layers in the image. It is not enough to select the image as a whole; you must select each layer. Then, press the I key to enter editing mode and use the paintbrush to select the image as a whole. AP Earlier in the week, Jets defensive back Darrelle Revis said that if he's playing in London this weekend, he'll start to think about his upcoming bonus. Today, Revis was asked if he thought he could be skipping the bonus if the Jets lose this week. "If I don't play, it doesn't matter, right?" Revis said, via Joel Corry of the Wall Street Journal. "I can sit home, I can watch my television, I can do whatever I want to do. If I play, that's when you start thinking about it and all that stuff. You start really counting. So that's really what it's going to be." Even after playing just six games this season, Revis' base salary for 2017 is \$12.25 million. So it's a little odd that Revis is telling the media that he hasn't thought about his bonus yet, but also saying that he will unless the Jets lose.

Q: What are the differences between MSI, RPM, SP1, etc.? I see these terms for different types of installations listed in many places when referring to installation on multiple machines. A: All of them are package managers. They are all very different in how they install software. RPM / DEB is for installing software on Redhat, Debian, etc. They use the dpkg tool to install software, and control which files should be installed. The standard install command is 'rpm -i'. MSI is for Windows. It uses an MSI (WUSA) file to control the install. Standard install command is: 'msiexec /qb /i mysetup.msi' (Uac prompt does not work) SP is for Windows Update. You can ask for an auto update, install it, or download it as an MSU (MSU stands for 'Microsoft Update'). You can also just install it manually. The installer is 'WUInstall.exe'. A: Install can mean "To set up", "To install" or "To set the system state in a way that makes a program or package available for use". MSI stands for Microsoft Installation (MSI) and SP stands for "System Packages (similar to RPM for Redhat-based systems). The main difference here is that RPMs come with an associated package manager, so you would run rpm -i [package name] RPMs could also be used to install packages on non-Redhat based systems. MSI files were developed for Windows and works differently from an RPM. MSI's have traditionally been installed using the command line msiexec /i Setup.msi You can also use the "Express" installer (msiexec /qb) which will allow you to choose to install some things, and not others. The installer will also prompt you in the dialog if you need admin access (usually a "yes" prompt). SP is specifically for Windows Updates. There are two types of Windows Updates. Automatic Updates and Manual Upgrades. Automatic updates are any updates for any of the Windows components that come out within a certain timeframe. You can set the Windows Update properties to allow them to be set to automatically update. You can also choose to set the options to allow you
