This has been done for a few reasons. Firstly, over recent years, motion capture technology has developed from capturing data passively to capturing data actively (with the player's help). This is fundamental to understanding the movement of players, and how they move. Players' movements are recorded every millisecond; however, capturing all those frames individually wouldn't work well for creating a world that feels like it's moving at a real speed. New motion capture technology (e.g. Kinect and Leap Motion) has made it possible to take multiple measurements all at once, meaning these frames are re-animated to create dynamic physics and motion that feels authentic. The game uses this technology to make the world move at real speed, and enables players to be more dynamic and perform real-life actions. In addition, there are two other reasons why data and technology have helped drive the evolution of a generation of football: simulation and AI. Additive manufacturing (3D printing) and re-use (fully-functional parts) have meant players can train in more realistic conditions, which is an absolute must for a team to be successful. On a much more complex and advanced level, the data generated by real-life professional matches can be compared to all the data that has been recorded from all players in all match situations in the past, and used to refine and enhance current player simulation. FIFA 20 introduced a new "FIFA World" animation engine, which improved its AI and player movement. This means that the more players, the better, because we can re-use most of the assets from FIFA 18 and understand how they work better. For example, we only need to create a few new animations for players, which means players will behave more naturally. They'll cover more distance and change direction more naturally. Conversely, FIFA 22 has been developed for the next generation of football, which is why all animations are bespoke. All features were designed with the latest academic research, using the latest cutting-edge technology to make the game feel that much more realistic. We've re-used many models that were created for FIFA 18, but it's not just about being faster and more realistic - the game is also much more reactive to players' actions.

We're helping to make player data more meaningful As mentioned above, motion capture technology has made a fundamental shift to active capturing of data. This has

He was 89. Born in 1909 in western Thrace, Eugenides studied history and literature at Oxford University, gaining his doctorate in 1932. He was born in a poor village in western Thrace, then part of the Ottoman empire, and was just a teenager when the Ottomans withdrew from the region, leaving it free to be divided between Greece, Bulgaria and Turkey. As his journey to fame and glory was to be locked in the no-man's-land between his homeland and the south-eastern corner of Turkey, Eugenides was to use these themes in his fiction, pulling together tales of love, loss, longing and the rhythms of life in a manner only he could. Eugenides wrote four novels, several short story collections and 23 books in total, but his best-known work was The Virgin Suicides, published in 1993 and made into a major film starring Kirsten Dunst and Jared Leto. The novel also inspired the 2006 musical, adapted for the London stage in 2011. The play and film told the story of a group of

This invention relates generally to the field of data processing, and more specifically, to determining that two graphics overlay windows are a match based on unique graphical features present on the windows. As the trend

towards consolidation of users and organization of the user's information continues, users will have more information stored in a single machine than they used to have in their workstations or personal computers. The users will have more work that is organized and shared across the user's network. Portions of this user's information will be in the form of electronic documents and the rest of it will be in electronic application data that the user accesses through programmatic data model infrastructures. The trend towards consolidation is driven by the fundamental structures of software that are evolving through industry efforts to standardize underlying technologies that have created a multi-vendor single language platform. The platform creates the software engine of users information (e.g., documents, application data, or combinations thereof). In the evolving platform, the shareable component for information is the data
