Afterward, you can begin to connect remotely to various systems that run the agent of Classroom Spy Professional. at the time of hospital admission for EPRF \[@CR23\], this characteristic may be useful for distinguishing EPRF from an early recurrence of HCC in patients with EPRF and for facilitating early treatment. Since the incidence of EPRF is much lower than that of an early recurrence of HCC in patients with HCC, it is likely that the latter can be more reliably distinguished from EPRF. There are some concerns about the treatment of EPRF. Generally, it is thought that EPRF is a benign condition, but surgical resection has been reported to be associated with tumour seeding and a high risk of local recurrence \[@CR24], \[@CR25\]. Recently, a multicentric study showed that tumour resection was not associated with local recurrence \[@CR26\]. Furthermore, surgery is not considered to be necessary for the treatment of EPRF because it is usually self-limited \[@CR27\]. If conservative management is successful for EPRF, regular follow-up is not indicated. Although the study regarding this issue is limited by the small number of patients, a surveillance protocol for EPRF may be considered for patients with HCC. Based on our results, F2, F3 and EPRF occurred at a later stage than F1. Since the patients with F1 and those with F2, F3 and EPRF had no differences in their background factors, the above-mentioned background factor may be related to the progression of the disease from the earlier stage to the later stage. This study is limited by its retrospective nature, the fact that it did not include patients with EPRF, and the relatively small number of study cases. In addition, it is unclear whether the F1 and the F2 were synchronous or metachronous. However, for these reasons, our results should be interpreted with caution. Furthermore, the role of image analysis with fusion imaging or magnetic resonance imaging to identify EPRF and to classify liver nodules was not evaluated in this study. Conclusion {#Sec12} ===== In conclusion, our study showed that the clinicopathological background factors of HCC
