The security updates are good news in general, for Windows users who have been monitoring their computers for any more signs of the Advanced Persistent Threat (APT) attacks. The other change that we will be reporting on, is that PGP is an officially supported cryptographic toolkit for Microsoft's email clients. What Is PGP? PGP is a very old public-key cryptographic toolkit. The name stands for Pretty Good Privacy and it has been around for many years, with versions having been developed for various computer systems before Microsoft used it as a default way of sending secure messages. The OpenPGP project, the developers of PGP, released a specification for public-key cryptography in 1996 and has continued to update the specification over the years to be compatible with a range of different operating systems. The current version of the specification is version 4.2. What Does PGP Do? PGP takes public-key cryptography and combines it with a number of access control technologies. The keys that are used to secure messages are called "private keys" whereas the keys that are used to open messages are known as "public keys". The most common use for PGP is to give people and companies the ability to send each other secure and encrypted emails. It's often used within corporate firewalls to authenticate and encrypt messages as they 1cdb3666d
